Conway's Game of Life

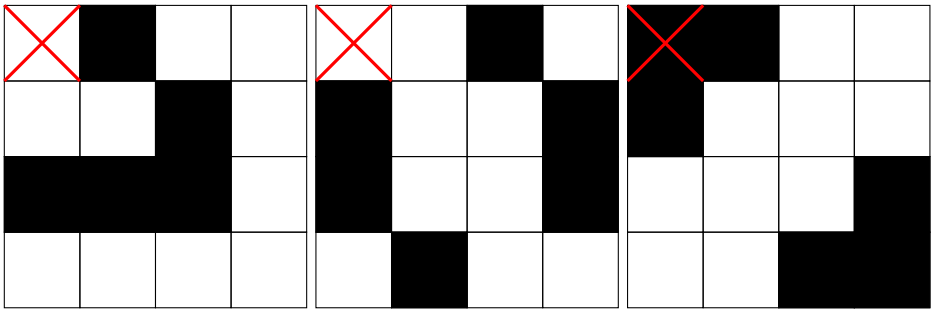
Exercise 1.1: Design of the Cellular Automaton

Exercise 1.2: Implement Conway's Game of Life

Exercise 1.3: Implement a Command Line Interface

Starting cell of multi-cell figures at the grid position (x,y)

All multi-cell patterns use the top-left corner as their anchor point (x, y), marked with a red X in the diagrams below. When placing patterns using commands like `glider 5 5`, the pattern is positioned such that its top-left cell aligns with grid coordinates $(5, 5)$. The toroidal grid behavior ensures that patterns wrap around the world boundaries. For example, placing a *glider* at $(width - 1, height - 1)$ will cause parts of the pattern to appear at the opposite edges of the grid.



Glider **Toad** **Beacon**

Exercise 1.4: Optimization Level and Compilation Settings

Exercise 1.5: Simulation Time per Grid Size
